

# Biology Bricks: Activity

## The Weight Test

Finding out how different materials drop from height can be a fun experiment. And it's so simple to do.

*You will need:*

*Random materials from anywhere you can find them.*

*A large container of water.*

## Instructions

1. Grab two items that you want to test. Ideally, they need to be different weights.
2. Find a high place from which to drop them.
3. Hold one in each hand and drop them.
4. You'll see which one hits the ground first. This is the test.
5. For added experimentation, try dropping items into a container of water. The different materials will show you how gravity works underwater.
