Biology Bricks Keywords

What This is About

Please use this document to help further your knowledge, by printing out the keywords associated with the relevant page.

This document is set up for you to cut out the keywords (and laminate them if you think it will help), to be used as a quick guide reference for the subject matter that is included.

Warning

Please note: the keywords included in this document are those that link with the page subject matter. They may relate to other pages as well, but they are meant for the page that the link is provided from. Use them as a resource as you so wish.

Printing

Please feel free **not** to print this page of the document, it is merely a reference and information page.

Waste

Waste is all the by products of what we create, eat and transfer from other products that we don't use.

Management

How we manage waste is important. If something were to go wrong, it can cause disaster (for example and oil spill) in the local or worldwide area.

Removal

The removal of waste product happens in a series of different methods. It varies depending on what type of waste it is.

Landfill

A landfill is an area that set aside for the local area and is filled in with waste materials.

Recycling

Recycling is carried out so we can reuse the different materials again. There are a few different types of material that can be recycled, such as paper, plastic, tin, and more.

Chemical

Sometimes we have to use chemicals to process or treat waste. How often do you use bleach in your toilet when you clean?

Industrial

Industrial waste includes strong liquids that are harmful to the environment, and other various materials that are considered waste.

Domestic

Domestic waste is what we put on the kerbside to be picked up the refuse collectors each week. It includes green materials too for recycling.

Commercial

Commercial waste is what is created by places such as restaurants, and can be similar to what domestic waste is.

Household Waste

Household waste is created from you doing things every day. You put something in the bin, it is considered household waste.

Fertiliser

Fertilisers are used to treat fields, but can also be waste product. The left over fertiliser is sent to be processed to large centres that deal with these types of liquids or pellets.

Farming

Farming techniques have changed over the decades, and still produce waste materials, but they are always looking for innovative methods to reuse or reduce the amount they produce.

Restaurant

A restaurant creates commercial waste. This is processed in similar fashion to a household. You go there and don't eat all your food, and it's going in a bin.

Medical

Medical waste includes things like PPE (Personal Protective Equipment), injection equipment and more.
