

Biology Bricks Keywords

What This is About

Please use this document to help further your knowledge, by printing out the keywords associated with the relevant page.

This document is set up for you to cut out the keywords (and laminate them if you think it will help), to be used as a quick guide reference for the subject matter that is included.

Warning

Please note: the keywords included in this document are those that link with the page subject matter. They may relate to other pages as well, but they are meant for the page that the link is provided from. Use them as a resource as you so wish.

Printing

Please feel free **not** to print this page of the document, it is merely a reference and information page.

Plant

A plant, usually green in colour, gives us oxygen we need to breathe. While a major producer, there are others that create oxygen for us, like algae.

Respiration

Respiration happens with plants, where oxygen and carbon dioxide are exchanged in plants through photosynthesis.

Biodiversity

Biodiversity is the amount of different species within a given area. It can be high or low, depending where in the world it is.

Habitat

A habitat is smaller than an ecosystem, and deals with the populations of animals in families, rather than the whole lot.

Ecosystem

An ecosystem is the entire populations of animals, birds and insects in a given area, who all interact with each other.

Deforestation

Deforestation is the process of removing trees in order for uses like paper, and using the land for other uses than as a forest.

Chlorophyll

Chlorophyll is the green pigment we see plants as being. It is a green liquid that is created by chloroplasts, and organelle within the plant cells.
