

Biology Bricks Keywords

What This is About

Please use this document to help further your knowledge, by printing out the keywords associated with the relevant page.

This document is set up for you to cut out the keywords (and laminate them if you think it will help), to be used as a quick guide reference for the subject matter that is included.

Warning

Please note: the keywords included in this document are those that link with the page subject matter. They may relate to other pages as well, but they are meant for the page that the link is provided from. Use them as a resource as you so wish.

Printing

Please feel free **not** to print this page of the document, it is merely a reference and information page.

Carbon Sink

A carbon sink is a natural or man-made environment where carbon is drained - a forest is a good example of this.

Environment

An environment where carbon is removed extensively from the surrounding area.

Absorption

Trees and oceans and the organisms within them absorb carbon to produce oxygen.

Natural

A natural environment such as a forest or peat bog is an area of natural making that is classed as a carbon sink.

Artificial

Artificial carbon sinks, such as sequestration, where carbon is placed under the ground and stored to remove it from the atmosphere.

Man-made

Man-made carbon sinks include the movement of carbon underground to the lower crust of the planet.

Large Area

Carbon sinks are usually large areas of forested land, peat bogs and oceans.
